Week 3_Day5: Mini-Project – Task Tracker Application

Program	3-Month MERN Stack Internship Program
Intern Name	Mohsin Ali
Week	Week_3 (Day 5)
Date	10 July, 2026

Day 5: Mini-Project – Task Tracker Application

1.1 Topics Studied

- DOM manipulation using JavaScript
- Event delegation for handling user interactions efficiently
- JavaScript arrays for storing and managing application data
- Dynamic creation, updating, and deletion of HTML elements
- Event handling and user interaction in web applications
- Building responsive and interactive web interfaces using vanilla JavaScript

1.2 Task Description

Developed a **Task Tracker** application using pure vanilla JavaScript. The application enables users to create and manage a list of daily tasks through an interactive interface. Users can add new tasks, mark existing tasks as completed, and remove tasks from the list when they are no longer needed. The primary objective of this project was to gain practical experience with DOM manipulation, event delegation, and array-based data management while building a fully functional web application without using any external libraries or frameworks.

1.3 Implementation Details

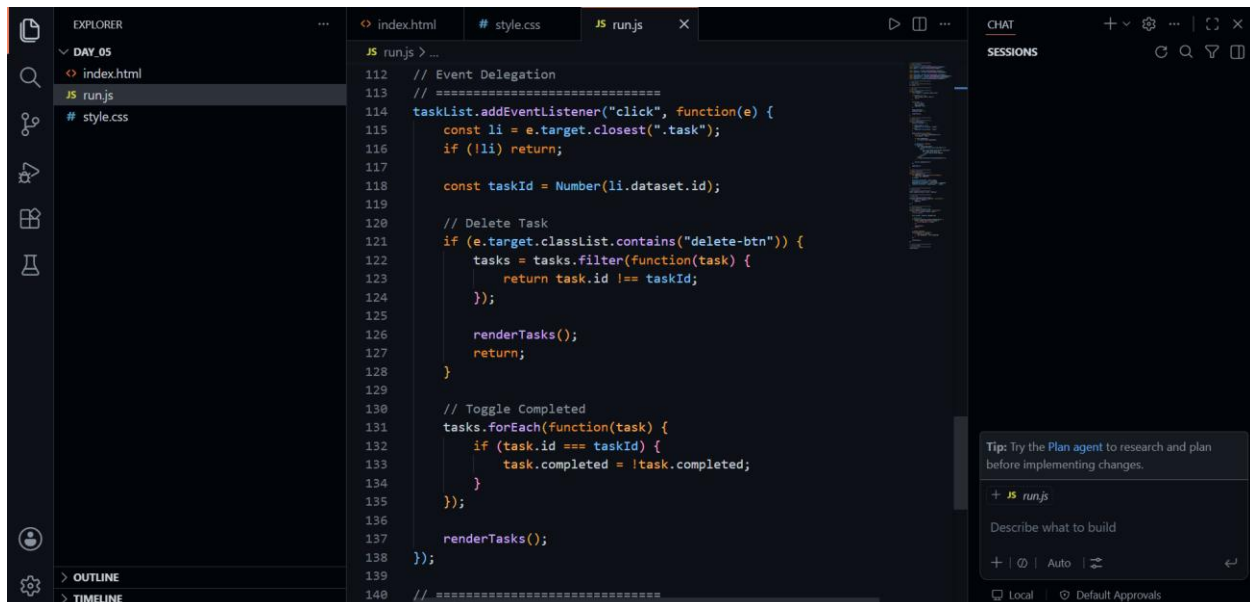

- Designed a clean, responsive, and user-friendly interface using HTML and CSS.
- Created an input field and action button to allow users to add new tasks dynamically.
- Implemented JavaScript logic to validate user input before adding tasks to the list.
- Used JavaScript arrays to store and manage task information during application execution.
- Dynamically generated task items using DOM manipulation techniques.

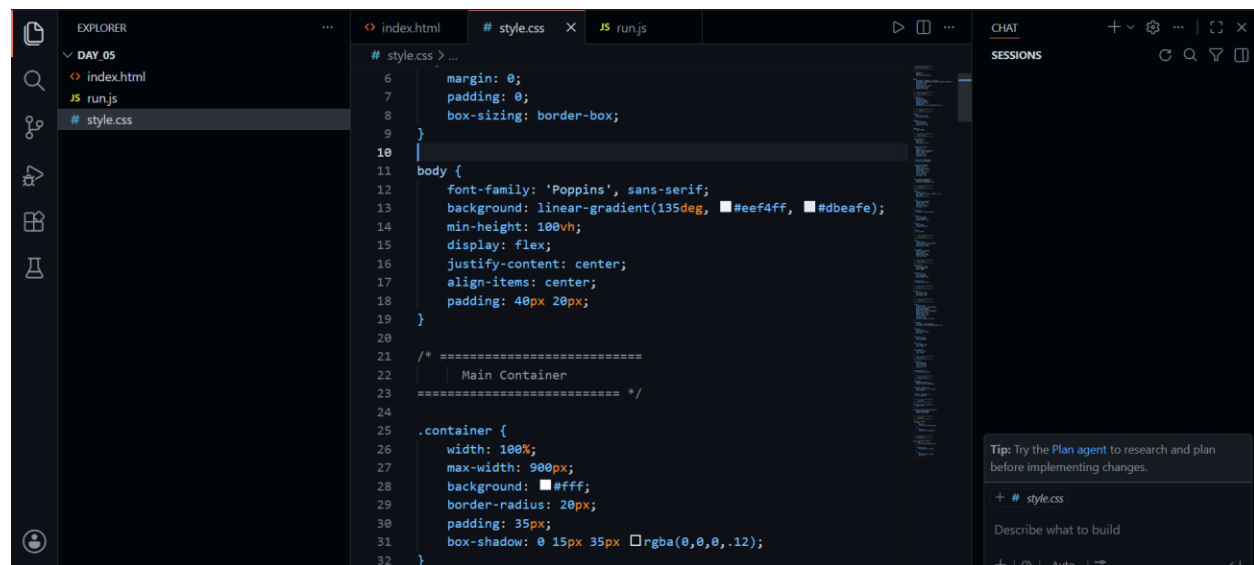

- Implemented event delegation to efficiently manage click events for dynamically created task elements.
- Added functionality to mark tasks as completed, providing a clear visual indication of their status.
- Implemented task deletion functionality, allowing users to remove completed or unnecessary tasks from the list.
- Organized the JavaScript code into logical sections to improve readability and maintainability.
- Ensured the application remained responsive and functioned correctly across different screen sizes and browsers.

1.4 Outcome

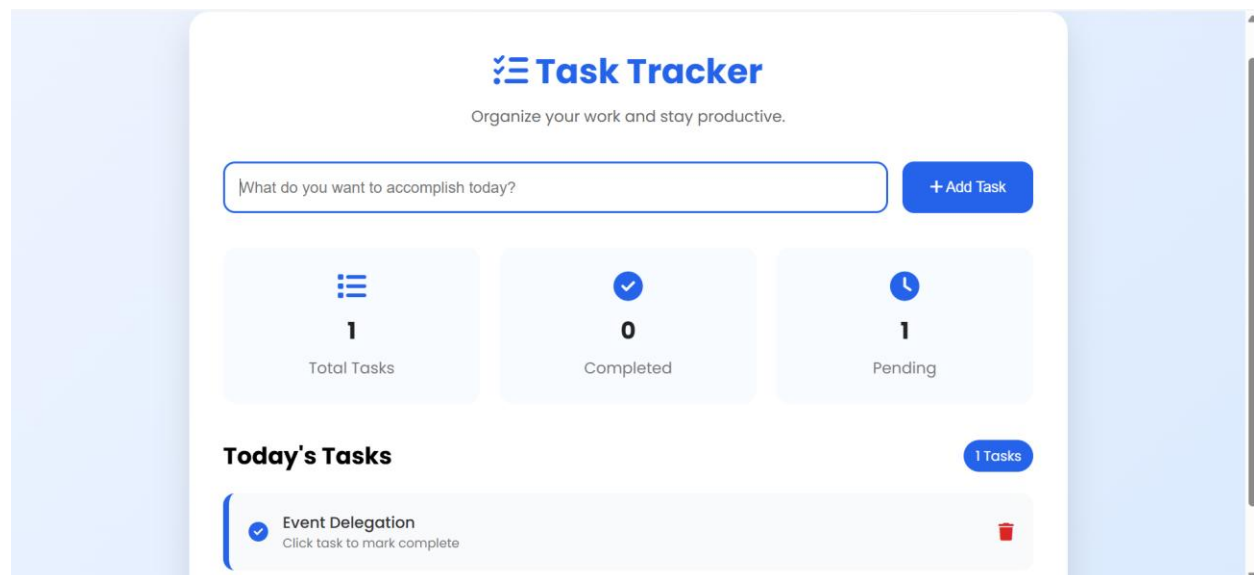

The Task Tracker application was successfully completed and met all the required functional requirements. Through this project, I gained hands-on experience with JavaScript DOM manipulation, event delegation, arrays, and dynamic user interface updates. It also strengthened my understanding of building interactive web applications using pure JavaScript and reinforced best practices for writing organized and maintainable frontend code.
